private int id;

```
//如果必需,请写出 Vehicle 类的构造器;不是必需就不写。(2分)
    public int getDrivers() {
        return drivers;
    public int getId() {
        return id;
public class Car extends Vehicle {
    private int guests;
    //请根据题目,写出 Car 类的构造器;不是必需就不写。(3分)
    public String getLoads() {
        return ("carId:" + this.getId() + ";guests:" + guests);
public class Truck extends Vehicle {
    private int loads;
    public Truck(int id, int drivers, int loads) {
        super(id, drivers);
        this.loads = loads;
   //请根据题目,写出 Truck 类的 getLoads()方法。(2分)
   public static void main(String[] args) {
        LoadsCountable[] arr = new LoadsCountable[2];
        arr[0]=new Car(1,3);
        arr[1]=new Truck(2,4,30);
   //请使用 for 循环,并且使用 arr 数组,完成程序,能够得到控制台输出。(3分)
控制台输出:
                carId:1;guests:3
                TruckId:2;drivers:4;Loads:30
```
